

【Document Name】 Abstract

【Abstract】

【Object】 There are provided a communication terminal and a communication system which can eliminate necessity of complicated setting inputs related to communication in a communication terminal in performing dial-up connection to a communication apparatus on a network from the communication terminal.

【Means for Achieving Object】 Since a communication terminal is provided with a receiving device (transmitting and receiving device 157) which receives connection information such as a dial-up telephone number, attribute information, a URL, an IP address, gateway information and a DNS for making communication connection to a photograph sharing service 90 on the Internet 48 from a cellular phone 40, and a transmitting and receiving device (transmitting and receiving device 157) which sends and receives the photograph sharing service 90 and the information such as an image based on the connection information received from the cellular phone 40, it becomes possible to eliminate necessity of complicated setting inputs related to communication in the a electronic camera 10 in performing dial-up connection to the Internet 48 from the electronic camera 10.
